26 março de 2012 – Chegada a Auckland

A close-up photograph of several bright red Pohutukaua flowers. The flowers have a dense, brush-like appearance with many fine, red stamens radiating from a central point. They are surrounded by thick, dark green, oval-shaped leaves. The lighting is bright, highlighting the texture of the petals and the vibrant color of the flowers.

PROTECT OUR KAURI

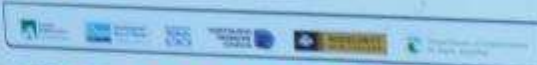

Kauri dieback disease is killing kauri trees.

It spreads via soil movement. Act now to stop its spread.

ALWAYS

- Keep to the defined tracks
- Clean your footwear before and after leaving kauri forest areas
- Stay away from kauri tree roots

Report sightings of diseased kauri to the Kauri Dieback Response Team on
0800 NZ KAURI or visit www.kauridieback.co.nz

CLEAN YOUR SHOES ON THE WAY IN AND OUT

➤ Scrub your shoes

➤ Spray your shoes

➤ Keep to the track

Stop the spread of kauri dieback

HISTORY

THE FIRST EXPLORERS

Local Maori had long known of the existence of caves in the Waitomo region, however they chose not to reveal their secret until 1887, when Chief Tane Tinorau was persuaded to explore the Waitomo Glowworm Caves by an English surveyor, Fred Mace. They floated into the cave via the Waitomo river on a raft of flax stems, with candles as their only lighting.

Imagine their excitement as their eyes adjusted to the darkness and they became aware of the multitude of glowworm lights around them! They returned many times, finding easier access points and discovering extraordinary limestone formations.

Government surveyors later mapped the cave and by 1889 the cave had opened to visitors. Many of the staff employed at the Waitomo Glowworm Caves today are direct descendants of Chief Tane Tinorau.

ARANUI CAVE

In 1910, a young Maori named Ruruku Aranui and his dog discovered a new cave in the bush. A wild pig they were chasing disappeared into a hole in the side of the hill and the dog followed in hot pursuit. Its barking led Ruruku to the hole and crawling inside, he discovered a huge cavern.

The richly decorated Aranui Cave is a geological rarity and is considered to be one of the most beautiful caves in Waitomo. Guided tours take you along safe boardwalks into tall narrow chambers. The stunning shades of pink, white and pale brown stalactites are truly spectacular.

Aranui Cave is a 'must see' when visiting Waitomo.

WAITOMO

ONE DESTINATION, MANY ATTRACTIONS

Beneath the surface it all begins, all the hidden treasures of the underworld, only at Waitomo.

RUAKURI GUIDED TOUR

A taste of everything! Amazing limestone formations, glowworms, an engineering masterpiece, underground rivers, hidden waterfalls, Maori legends, Waitomo's longest guided walking tour.

CAVE TUBING AT ITS BEST!

Live the legend with New Zealand's original and most popular black water rafting operator. Take a legendary adventure and explore subterranean rivers that flow through ancient cave systems whilst seated on an inner tube.

WAITOMO

GLOWWORM CAVES®

Explore our secret world

Waitomo

MEANING 'WATER ENTERING A HOLE IN THE GROUND' is home to an awesome underground world that has captivated millions of visitors for more than a century.

Experience the magic of an ancient labyrinth of limestone caves and formations and be enchanted by your silent boat ride through the spectacular Glowworm Grotto.

THE CAVES

LIMESTONE

About 30 million years ago, when Waitomo lay quietly beneath the sea, the remains of countless marine creatures settled gently on the seabed and accumulated to form the rock strata we call limestone – made up almost purely of fossils and the mineral Calcium Carbonate [CaCO_3].

THE CAVES

Over the last 24 million years, the Waitomo landscape has been shaped by faulting, earthquakes and volcanic eruptions. The limestone layers were pushed up from the sea floor, buckled and broken. Cracks and joints separating the huge blocks allowed water to flow between them, gradually dissolving and carving out the caves that we see today. Inside the caves, stalactites, stalagmites and other cave decorations began to grow, formed over time as water gradually dripped from the roof, dropped to the floor or flowed over the walls and rocks.

STALACTITES AND STALAGMITES

These fascinating limestone decorations are formed by water dripping from the roof, falling to and flowing over cave walls leaving in its wake a deposit of crystalline Calcium Carbonate [CaCO_3].

Crystal layers accumulate over time, growing longer or thicker – stalactites hang down from the cave ceiling, and stalagmites grow up from the cave floor – creating 'living sculptures' of breathtaking beauty and majesty.

Cave decorations can take hundreds of years to form. It has been estimated that it can take about 100 years to form 1 cubic centimetre of stalactite.

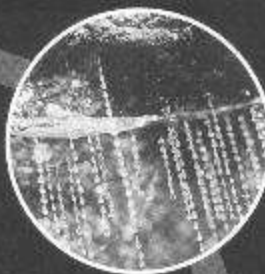

1. EGGS

The female fly lays around 120 small spherical eggs. After around 20 days the young larvae hatch from the eggs.

2. LARVA

After hatching, the young larvae build a nest, put down lines and feed. Sticky substances on the lines trap insects and these are drawn up and devoured. Even at this small size, less than 3 millimetres long, they emit a visible light and slowly grow over 9 months to the shape and size of a matchstick.

THE GLOWWORM LIFE CYCLE

4. ADULT

The adult glowworm looks like a large mosquito. They have no mouth and their only function is to reproduce and disperse the species. Usually a male is waiting for the female to emerge from the pupa, mating takes place immediately and the cycle continues. Adults live no longer than a few days.

3. PUPA

The pupa is the same as the cocoon stage in the butterfly lifecycle; it is the stage between the larva and the adult fly. This will last about 13 days with the pupa suspended by a thread.

ARACHNOCAMPA LUMINOSA

(spider-like, light-producing larva)

IS A GLOWWORM SPECIES
UNIQUE TO NEW ZEALAND

It is the larval stage of a two-winged insect which gives off light to attract food in the form of other flying insects. To survive, the glowworm needs a special habitat: humidity to prevent it from drying out, a sheltered surface to hang from and suspend its sticky, spider-like feeding lines, a calm atmosphere to prevent the lines from tangling, darkness to allow its light to attract food and a plentiful supply of insects to eat. The Waitomo Glowworm Caves provides a perfect environment, with an abundance of insects brought into the cave via the river.

Welcome to Fiordland National Park

Te Wāhipounamu – South West New Zealand
World Heritage Area

OVERNIGHT CAMPING IN ALL CARPARKS,
INCLUDING MILFORD SOUND IS NOT PERMITTED.

Camping along the Milford Road is only permitted at designated DOC camping areas or commercial accommodation providers.

Please dispose of campervan toilet waste at waste stations sited at Te Anau, Knobs Flat and Milford Sound/Piopiotahi.

Do not feed the kīa.

No dogs or other pets are allowed in Fiordland National Park.

DISTANCE

Te Anau to Milford Sound/Piopiotahi is 119 kilometres (74 miles).
Look out for the historic, white, mile-marker-pegs along the road.

ROAD CONDITIONS

Between May and November the Milford Road can be affected by adverse weather and snow conditions particularly between the Lower Hollyford turn-off and Milford Sound. Roadside signs notify motorists of any chain restrictions or road closures.

No cycling/walking during the avalanche season and/or the No Stopping restriction zone from Falls Creek to the Chasm is allowed.

For current road conditions phone 0800 44 4449.

Various short walks.

INvaders

Greetings! I'm a stoat. These bush birds are easy to catch and taste excellent! I'll also eat just about anything else that moves. Insects, mice, bush wetae and beetles.

G'dday! I'm an Australian brush-tailed possum and I love the Pteridinium bush. My favourite meal around here is the mistletoe and the eucalyptus. Fun! My mates keep eating all the best stuff. Never mind, if I can't find enough vegies there's always the odd bird egg to eat.

Ilha Sul

Dunedin

metres from the junction.
 The route was chosen from seven proposed in 1877 because it opened up the
 largest area of Crown lands, presented the fewest engineering difficulties
 and was the most direct route to Dunedin. By the mid-1870s the gold rushes
 in Otago were well past and attention was being focused on the agricultural
 and pastoral potentials of Dunedin's hinterland. Roads were notoriously bad
 and railways were seen to offer the best means of improving transport and
 communications.

Construction of the railway began in June 1879, but within a year it had
 become a victim of the economic depression that persisted through the
 1880s. It was 1889 before the first section was opened to traffic, and
 only the 27km to Hindon in the middle of the Taieri Gorge.
 Middlemarch was reached in 1891 and thereafter progress was
 slower; the rails reached Ranfurly in 1898, Omakau
 in 1906 and Clyde in 1907. Here work
 stopped until 1914 and it was not until 1921 that the line
 was completed to Cromwell.

At its late arrival, the railway played a major part in
 the development of Central Otago. Thousands of tons
 of produce and fruit, and hundreds of thousands
 of livestock were railed yearly to Dunedin
 for export. Supplies for Central Otago went by
 rail from Dunedin that travelled overnight for early
 morning deliveries in the country towns.

Consolidating protected the railway from
 closure until 1961 for the carriage of
 freight until 1983 for general freight. In 1980
 the Clyde Dam required the closure
 of the line between Clyde and Cromwell,
 and cement and steel for the dam
 kept the business for the railway until 1989.
 That year the Minister of Railways
 announced the line would be closed on 30 April

Taiari Railway

Mayor of Dunedin announced that the City
 would build a line through the Taieri Gorge and as far as
 the community raised \$1 million to finance
